Math 10350 – Exam 02 Review

1. A differentiable function $g(t)$ is such that $\quad g(2) = 2, \quad g'(2) = -1, \quad g''(2) = 1/2.$

(a) If $p(t) = g(t)e^{t^2}$ find $p'(2)$ and $p''(2)$. (Ans: $p'(2) = 7e^4$; $p''(2) = 28.5e^4$)

(b) If $f(t) = \sec(2\pi t) \cdot g(t)$ find the slope of the tangent line to the graph of $f(t)$ at $t = 2$. (Ans: $f'(2) = -1$)

(c) If $h(t) = \dfrac{1 - t^2 g(t)}{t^2}$ find the derivative of $h(t)$ at $t = 2$. Hint: No quotient rule needed. (Ans: $h'(2) = 3/4$)

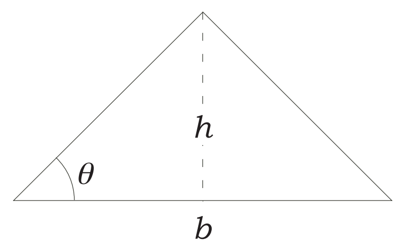
(d) Let $s(t) = \cos(\pi g(t))$ be the position of a particle moving on a straight line, find its velocity and acceleration at the moment when $t = 2$. (Ans: $s'(2) = 0$; $s''(2) = -\pi^2$)

(e) If $q(t) = \ln\left(\dfrac{4 - g(t)}{4 + g(t)}\right)$ find the instantaneous rate of change of $q(t)$ at $t = 2$. Hint: No quotient rule needed.
(Ans: $q'(2) = 2/3$)

(f) Find the linearization of $g(t)$ at $t = 2$ then estimate the value of $g(1.8)$? (Ans: $g(1.8) = 2.2$)

2. Consider a cylindrical metal rod is heated up in a furnace. When the volume of the rod is 80π cm^3 and its height is 5 cm, both radius and height are growing at a rate of 0.5 cm/min. At what rate is the volume is growing? (Ans: At required moment $r = 4$ cm and so $dV/dt = 28\pi$ cm^3/min.)

3. An **isosceles** triangle (see figure below) with **fixed** area of 50 cm^2 has its height decreasing at a rate of 0.1 cm/sec. At what rate is the base of the triangle changing at the instant when its height is 5 cm? How fast is the angle θ changing at the same instant? (Hint: You do not need to find θ explicitly.)
(Ans: $db/dt = 0.4$ cm/sec. Note that $\tan\theta = h/(b/2) = h^2/50$. $d\theta/dt = -0.016$ radian/sec.)



4. Two cars start from the same intersection at the same time. Car A heads east at a constant speed of 40 miles per hour, and Car B heads north at a speed of 30 miles per hour. (a) Find the distance s between Car A and Car B in terms of time t. (b) How fast is the distance between the cars changing? (c) If car B is speeding according to the position $x(t) = 10t^2$ miles (measured from the intersection), how would your answers in (a) and (b) change? (Ans: (a) $s(t) = 50t$; (b) $s'(t) = 50$; (c) $s(t) = 10(16t^2 + t^4)^{1/2}$; $s'(t) = 5(16t^2 + t^4)^{-1/2}(32t + 4t^3)$)

5. If $y - 4\cos(y) + 3xy^2 = x^2 - 8$ find $\dfrac{dy}{dx}$ and the tangent line to the curve at the point $(2, 0)$.
$\left(\text{Ans: } y' = \dfrac{2x - 3y^2}{4\sin(y) + 6xy + 1};\ y = 4x - 8\right)$

6. A block of ice with a square base has dimension x inches by x inches by $3x$ inches.

(a) If the block of ice is melting so that its surface area A is decreasing at a rate of 2 in^2/sec, find the rate at which x is changing when $x = 12$ inches. (Ans: $dx/dt = -1/168$ in/sec)

(b) Estimate the change in volume when x changes from 12 in to 12.5 in. What is the corresponding percentage change in volume. (Ans: $\Delta V = V'(12)\Delta x = 648$ in^3; $\frac{\Delta V}{V} \times 100\% = 12.5\%$.)

7. A ball is thrown into the air and its height in feet (measured from the ground) after t seconds is given by $s = -16t^2 + 32t + 48$ until it hits the ground.

(a) What is the initial height of the ball? (Ans: 48 ft)

(b) What is the maximum height of the ball? (Ans: 64 ft)

(c) What is its velocity at moment when the ball hits the ground? (Ans: -64 ft/sec)

8. Find the third derivative of the following functions: (a) $y = 3\tan(3\theta)$; (b) $y = (1 - t)^{5/2}$; (c) $y = x \cdot 3^x$
(Ans: (a) $324\sec^2(3\theta)\tan^2(3\theta) + 162\sec^4(3\theta)$; (b) $-\frac{15}{8}(1 - t)^{-1/2}$; (c) $(\ln 3)^2(x \cdot 3^x \ln 3 + 3^{x+1})$)

9. A point is moving on the curve $x^3 + y^3 = xy + 1$. If at the point $(1, -1)$, the velocity of the point in the $x-$direction is -2 units per minute, what is its velocity in the y-direction? (Ans: $dy/dt = 4$ unit/min)

10. A snowball melts so that its surface area decreases a rate of 1 cm^2/min. (a) Find the rate at which the diameter is changing when the diameter is 10 cm. (b) Estimate with calculus, the change in the volume when the diameter of the snowball changes from 10.5 cm to 10 cm, (c)Estimate with calculus, the change in the volume 10 seconds after the diameter is 10 cm. Give units to all your answers.

(Ans: (a) $-\frac{1}{20\pi}$ cm/min; (b) $\Delta V = V'(10)\Delta L = -25\pi$ cm^3; (c) $\Delta V = \frac{dV}{dt}(0)\Delta t = -5/12$ cm^3)

11. Using limits find the derivative of $f(x) = \sqrt{x+1}$. Write down the linear approximation to $f(x)$ at $x = 3$. Estimate $\sqrt{3.8}$. Draw a graph to illustrate your estimation. (Ans: $f(x) \approx \frac{1}{4}(x-3) + 2$ for x near 3; $\sqrt{3.8} \approx 1.95$)

12. Find the derivatives of the following functions: (a) $y = (1+x^2)^x$; (b) $y = e^{e^x}$; (c) $y = x^{x^2}$.

(Ans: (a) $(1+x^2)^x \left[\frac{2x^2}{1+x^2} + \ln(1+x^2)\right]$; (b) e^{e^x+x}; (c) $x^{x^2}(x + 2x\ln x)$)

13. The atmospheric pressure P (in kilopascals) on Planet X at altitudes h (in km) is approximately

$$P(h) = 100e^{-0.02h}.$$

Using calculus, estimate the value of $P(10.1) - P(10)$. Leave answer in terms of e. What is the corresponding percentage change in pressure? (Ans: $-0.2e^{-0.2}$ kilopascals; -0.2%)

14. Find the value of k such that the following function $f(x)$ is continuous at $x = 0$:

$$f(x) = \begin{cases} \dfrac{\sin(9x^2)}{3x} & x \neq 0 \\ k & x = 0 \end{cases}$$

Show your work using limits very carefully. (Ans: $k = 0$)

15. Find the values of the following limits:

(a) $\displaystyle\lim_{x\to 0^+} x\cos\frac{1}{x^2}$; (b) $\displaystyle\lim_{x\to 1}\frac{\sin(x-1)}{1-x}$; (c) $\displaystyle\lim_{x\to 0}\frac{\sin 5x}{\sin 3x}$; (d) $\displaystyle\lim_{x\to 0}\frac{\sin^2 5x}{\sin 3x}$. (Ans: (a) 0; (b) -1; (c) 5/3; (d) 0)

16. Find $\dfrac{dy}{dx}$ if $e^{xy} + y^2 + x = 1$. $\left(\text{Ans: } \dfrac{dy}{dx} = \dfrac{-ye^{xy} - 1}{xe^{xy} + 2y}\right)$

17. At noon ship A is 8 km west from ship B. Ship A is sailing south at 5 km per hour and ship B is sailing north at 3km per hour.
(a) Find a formula for the distance L between the two ships. (Ans: $L(t) = 8\sqrt{t^2+1}$ km)
(b) How fast is the distance between the ships changing at 1p.m.? (Ans: $4\sqrt{2}$ km/h)

18. Consider the curve given by the parametric equations:

$$x = t\sin t; \qquad y = t\cos t.$$

(a) How fast are the coordinates x and y changing (relative to t) when $t = \pi$? (b) Find the equation of the tangent line at the point when $t = \pi$. Give your answer in the form $y = mx + b$.

$\left(\text{Ans: (a)} x'(\pi) = -\pi, y'(\pi) = -1; \text{(b)} y = \dfrac{x}{\pi} - \pi\right)$

19. Find $\dfrac{dy}{dx}$ for the given parametric equations below. Using your result, find (a) the equation of the tangent line to the curve at the given $t = t_0$, and (b) the values of $t$corresponding to the points on curve where the tangent lines are horizontal.

19(i). $x = e^{t^3} + t$; $\quad y = e^{2t} - 4t + 1$; $\quad t = 0$. (Ans: (a) $y = -2x + 4$; (b) $t = (\ln 2)/2$)

19(ii). $x = \sec\left(\dfrac{t}{2}\right)$; $\quad y = \cos(t) + \dfrac{t}{2}$; $\quad t = \dfrac{\pi}{2}$. Here restrict $0 < t < 2\pi$.

(Ans: (a) $y = -\frac{x}{\sqrt{2}} + 1 + \frac{\pi}{4}$; (b) $t = \pi/6, 5\pi/6$)

Multiple Choice

1.(5 pts.) The position of a particle moving on a straight line is given by $s(t) = \tan(t)$. What is the **acceleration** of the particle at time t?

(a) $4\sec(t)\tan^2(t)$

(b) $2\sec^2(t)\tan(t)$

(c) $\sec^2(t)\tan^2(t)$

(d) $2\sec(t)\tan(t)$

(e) $\sec(t)\tan^2(t) + 2\sec^3(t)$

2.(5 pts.) Find the linearization of $f(x) = 2xe^{x-1}$ at $x = 1$.

(a) $f(x) \approx 2(x-1) + 4$ for x near 1.

(b) $f(x) \approx (2x+2)e^{x-1}(x-2) + 1$ for x near 1.

(c) $f(x) \approx 4(x+2) + 1$ for x near 1.

(d) $f(x) \approx (2x+2)e^{x-1}(x-1) + 2$ for x near 1.

(e) $f(x) \approx 4(x-1) + 2$ for x near 1.

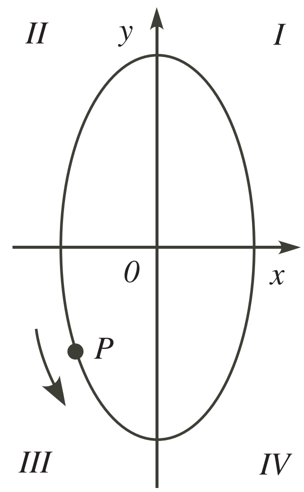
Class Time: __________________________

3.(5 pts.) Consider a particle P moving **counterclockwise** around the ellipse

$$4x^2 + y^2 = 5.$$

Which of the following statement is **TRUE** about $\frac{dx}{dt}$ and $\frac{dy}{dt}$ in Quadrant II?



(a) None of the choices.

(b) $\frac{dx}{dt} > 0$ and $\frac{dy}{dt} > 0$ when P is in Quadrant II.

(c) $\frac{dx}{dt} < 0$ and $\frac{dy}{dt} > 0$ when P is in Quadrant II.

(d) $\frac{dx}{dt} < 0$ and $\frac{dy}{dt} < 0$ when P is in Quadrant II.

(e) $\frac{dx}{dt} > 0$ and $\frac{dy}{dt} < 0$ when P is in Quadrant II.

4.(5 pts.) For the same Particle P above, find $\frac{dx}{dt}$ at $(1, -1)$ if $\frac{dy}{dt} = 2$ units per second.

(a) 1/2 units per second.

(b) 9/4 units per second.

(c) $-9/4$ units per second.

(d) -1 unit per second.

(e) 1 unit per second.

Class Time: __________________________

5.(5 pts.) Find the third derivative $\dfrac{d^3y}{dx^3}$ if $y = e^{3x} + x^3$.

(a) $\dfrac{d^3y}{dx^3} = 3x(3x-1)(3x-2)e^{3x-3} + 6$

(b) $\dfrac{d^3y}{dx^3} = 27e^{3x}\ln 27 + 6$

(c) $\dfrac{d^3y}{dx^3} = \dfrac{e^{3x}}{27} + 6$

(d) $\dfrac{d^3y}{dx^3} = 27e^{3x} + 6$

(e) $\dfrac{d^3y}{dx^3} = e^{3x} + 6$

6.(5 pts.) A rectangular shape is changing its dimensions such that its length L is **increasing** at 2 cm/sec and width W is **decreasing** at 1 cm/sec. At what rate is the area of the rectangle changing when $L = 5$ cm and $W = 4$ cm?

(a) -2 cm^2/sec

(b) 2 cm^2/sec

(c) 3 cm^2/sec

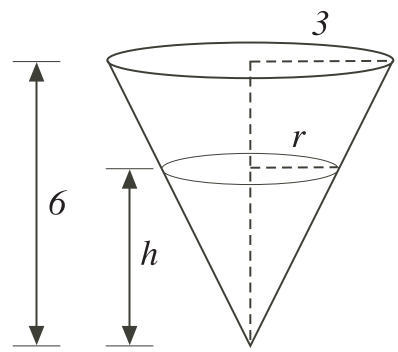
(d) -3 cm^2/sec

(e) 13 cm^2/sec

Name: ______________________________

Class Time: __________________________

7.(5 pts.) Let V be the volume of water in an inverted cone of radius 3 meters and the height 6 meters. Find the volume V of water in terms of the height h of the water level. You may use the formula $V = \frac{1}{3}\pi r^2 h$.



(a) $V = \dfrac{8\pi h^3}{3}$

(b) $V = \dfrac{2\pi h^3}{3}$

(c) $V = \dfrac{\pi h^3}{6}$

(d) $V = \dfrac{\pi h^3}{12}$

(e) $V = \dfrac{\pi h^3}{24}$

8.(5 pts.) The intensity I (in lumens) of light penetrating the water of a lake is related to the amount of sediments s in the water by $I(s) = s^{-2}$. If the amount of sediments $s = e^h$ where h (in meters) is the depth of the lake, what is the value of $\dfrac{dI}{dh}$ when $h = 2$ meters?

(a) $-2e^{-4}$ lumens/meter.

(b) $-e^{-4}$ lumens/meter.

(c) $1/4$ lumens/meter.

(d) $-1/4$ lumens/meter.

(e) e^{-4} lumens/meter.

9.(5 pts.) A continuous function $f(x)$ is such that for $0 < x < \pi$,

$$2\sin(x) \le f(x) \le 1 + \frac{1}{\sin(x)}.$$

What is the value of $\lim_{x\to\pi/2} f(x)$?

(a) $\sqrt{2}/2$

(b) 1

(c) 0

(d) 2

(e) $\sqrt{2}$

10.(5 pts.) Find the instantaneous rate of change of $f(x) = \dfrac{\sin x}{1+\cos x}$.

(a) $\dfrac{-\cos x - \cos^2 x + \sin^2 x}{(1+\cos x)^2}$

(b) $\dfrac{-1}{(1+\cos x)}$

(c) $\dfrac{1}{(1+\cos x)}$

(d) $\dfrac{-2}{(1+\cos x)^2}$

(e) $\dfrac{\cos x + \cos^2 x - \sin^2 x}{(1+\cos x)^2}$

Partial Credit

You must show your work on the partial credit problems to receive credit!

11.(12 pts.) **(a)** Using calculus, estimate the maximum error in finding the area of a 10×10 square if the maximal error in measuring its side is 0.1 cm.

(b) (Not related to the above) Find the value of k such that the following function $f(x)$ is continuous at $x = 0$:

$$f(x) = \begin{cases} 3k + \dfrac{(\sin 3x)^2}{4x} & x \neq 0 \\ \\ k + 4 & x = 0 \end{cases}$$

Carefully show all your work with limits.

Name: ______________________________

Class Time: __________________________

12.(12 pts.) Using logarithmic differentiation, find the derivative of the following function <u>in terms of x only.</u>

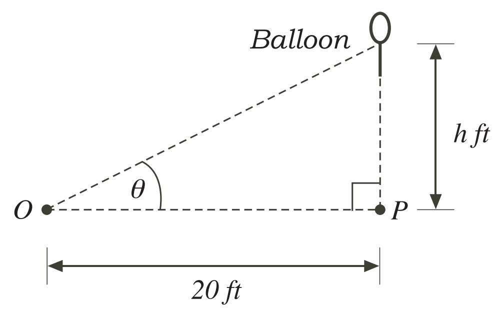
$y = (1+x)^{x^2}$

Name: ____________________________

Class Time: ________________________

13.(12 pts.) **(a)** Find the instantaneous rate of change of $f(x) = \ln\left(\dfrac{e^x + 2}{e^x + 4}\right)$.

(b) (Not related to the above) A balloon is released at a point P, 20 feet from an observer O, on a hot day with still air (See figure below). If the balloon is rising **vertically** at 3 ft/sec, how fast is the angle θ of elevation at O changing when $\theta = \dfrac{\pi}{4}$ radians. Your answer should contain no trigonometric functions.



Name: ____________________________

1.(5 pts.) What is the derivative of $\sec^2(5x)$?

(a) $2\sec(5x)\tan(5x)$

(b) $10\sec^2(5x)\tan(5x)$

(c) $10\sec(5x)$

(d) $5\tan(5x)$

(e) $10\tan(5x)$

2.(5 pts.) Find the linear approximation of the function $f(x) = \sqrt[5]{x} + 3$ at $x = -1$.

(a) $f(x) \approx \frac{1}{5}(x-1) - 2$ for x near -1.

(b) $f(x) \approx \frac{x^{-4/5}}{5}(x+1) + 2$ for x near -1.

(c) $f(x) \approx \frac{1}{5}(x-2) - 1$ for x near -1.

(d) $f(x) \approx \frac{x^{-4/5}}{5}(x-1) - 2$ for x near -1.

(e) $f(x) \approx \frac{1}{5}(x+1) + 2$ for x near -1.

3.(5 pts.) The volume of a spherical snow ball is **decreasing** at a rate of π cm^3 per second when its radius is 5 cm. What is the rate of change of the radius at this moment? You may use the formula $v = \frac{4}{3}\pi r^3$.

(a) $-1/100$ cm/sec

(b) $1/20$ cm/sec

(c) $1/200$ cm/sec

(d) $-1/500$ cm/sec

(e) $-1/20$ cm/sec

4.(5 pts.) Consider the motion of a particle moving on the circle $x^2 + y^2 = 10$. Find the value of $\frac{dy}{dt}$ when the particle is located at $(1, 3)$ and $\frac{dx}{dt} = -2$.

(a) $1/3$

(b) $-2/3$

(c) $-1/3$

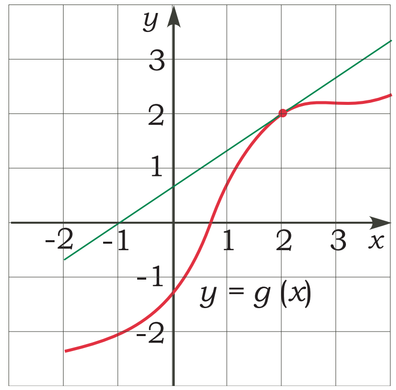
(d) $2/3$

(e) 2

Name: ____________________________

Instructor: ________________________

5.(5 pts.) The graph of the function $g(x)$ is given below. Find the derivative of $f(x) = g(x^2 + 1)$ at $x = 1$.



(a) $f'(1) = 4$

(b) $f'(1) = 4/3$

(c) $f'(1) = 2$

(d) $f'(1) = 2/3$

(e) $f'(1) = 3/2$

6.(5 pts.) The position function $s(t)$ at time t of a device floating in a pool measured from the bottom of the pool is given by:

$$s(t) = 5 + \sin(t) - \cos(t).$$

Find the instantaneous velocity of the device at time $t = \dfrac{\pi}{3}$.

(a) $5+\dfrac{1-\sqrt{3}}{2}$

(b) $\dfrac{-1-\sqrt{3}}{2}$

(c) $\dfrac{-1+\sqrt{3}}{2}$

(d) $\dfrac{1-\sqrt{3}}{2}$

(e) $\dfrac{1+\sqrt{3}}{2}$

Name: ______________________________

7.(5 pts.) Find the value of k such that the following function is continuous at $x = 0$:

$$f(x) = \begin{cases} 1 + \dfrac{\sin 5x}{\sin 7x} & x \neq 0 \\ k & x = 0 \end{cases}$$

(a) 2

(b) 12/5

(c) 5/7

(d) 12/7

(e) 7/5

8.(5 pts.) Suppose that

$$f(1) = 2, \qquad f(2) = 1, \qquad g(1) = 4, \qquad g(2) = 3,$$

$$f'(1) = 6, \qquad f'(2) = 5, \qquad g'(1) = 8, \qquad g'(2) = 7.$$

Let $h(x) = g(f(x))$. What is $h'(1)$?

(a) 42

(b) 12

(c) 40

(d) 14

(e) 48

Name: ______________________________

Instructor: __________________________

9.(5 pts.) Consider the function

$$f(x) = \begin{cases} \dfrac{x}{\sin(kx)} & \text{if } x < 0 \\ 2x + 5 & \text{if } x \geq 0 \end{cases}$$

Find the value of k, if it exists, so that $f(x)$ is continuous at $x = 0$.

(a) 5 (b) $\frac{1}{2}$ (c) 2

(d) $\frac{1}{5}$ (e) Does not exist.

10.(5 pts.) If $f(x) = \sqrt{2x+7}$, then $f'''(x) = ?$

(a) $-\dfrac{3}{8\sqrt{(2x+7)^5}}$

(b) $\dfrac{1}{\sqrt{2x+7}}$

(c) $\dfrac{3}{\sqrt{(2x+7)^5}}$

(d) $\dfrac{3}{8\sqrt{(2x+7)^5}}$

(e) $-\dfrac{3}{\sqrt{(2x+7)^5}}$

Name: ______________________________

Instructor: __________________________

11.(5 pts.) What is the derivative of $\tan(x^3+1)$?

(a) $\sec^2(x^3+1)+\tan(3x^2)$

(b) $-\cot(x^3+1)$

(c) $3x^2\sec^2(x^3+1)$

(d) $\sec^2(x^3+1)$

(e) $3x^2\sec(x^3+1)\tan(x^3+1)$

12.(5 pts.) The pilot of the helicopter flying over the sea observed that **the area** of an oil slick caused by a sunken ship is growing a rate of 4π square kilometers per hour. Assuming that the oil slick is **circular**, at what rate is **the radius** of the oil slick growing when its radius is 1/2 kilometers?

(a) 2 km/hr

(b) $\frac{\pi}{4}$ km/hr

(c) 2π km/hr

(d) $4\pi^2$ km/hr

(e) 4 km/hr

Name: ______________________________

Instructor: __________________________

Partial Credit

You must show your work on the partial credit problems to receive credit!

13.(10 pts.) (a) Consider the curve given by

$$y^3 - 2xy = 5 - x^3.$$

Use **implicit differentiation** to find $\dfrac{dy}{dx}$.

(b) For a certain curve C: $\quad \dfrac{dy}{dx} = \dfrac{x - y + 2}{x + y + 1}.$

If the point $(1, -1)$ is on the curve, find the equation of the tangent line to C at $(1, -1)$.

Name: ____________________________

Instructor: ________________________

14.(10 pts.)
14A. Find the derivative of $y = (1+x)^{e^{2x}}$ using logarithmic differentiation.

14B (Not related to above). Water is following in an inverted cone of radius 1 m and height 2 m at a rate of 0.5 m^3/min. How fast is the **radius** of the water surface growing when its diameter is 1m?

16.(10 pts.) **16A.** Consider the function $f(x) = \sqrt[3]{x}$.

i. Find the linear approximation of $f(x)$ at $x = -8$.

ii. Using (a), estimate the value of $\sqrt[3]{-7.8}$

16B. (Not related to above) Air is pumped into a perfectly spherical balloon of radius r. Using calculus, estimate the **percentage change** in the volume of the balloon when the radius changes from 3 cm to 3.05 cm.

You may use the formula $V = \dfrac{4\pi r^3}{3}$.

MATH 10350: CALCULUS A
EXAM II FREE RESPONSE SOLUTIONS

11. (a) Using calculus, estimate the maximum error in finding the area of a 10×10 square if the maximal error in measuring its side is 0.1 cm.

Solution. Let $f(x)$ denote the area of a square of side of length x, so that $f(x) = x^2$. Since f is differentiable at $x = 10$, we know that

$$\Delta f \approx f'(10)\Delta x,$$

where Δx is the change in x, and Δf the error. Since

$$f'(x) = 2x,$$

we have

$$\Delta f = (20)(0.1) = 2.$$

The maximal error in area is thus 2 cm^2.

(b) Find the value of k such that the following function $f(x)$ is continuous at $x = 0$:

$$f(x) = \begin{cases} 3k + \dfrac{(\sin 3x)^2}{4x} & x \neq 0 \\ k + 4 & x = 0 \end{cases}$$

Carefully show all your work with limits.

Solution. For f to be continuous at $x = 0$, we must have that

$$\lim_{x \to 0} f(x) = f(0) = k + 4.$$

We have $\lim_{x \to 0} f(x) = \lim_{x \to 0} \left(3k + \dfrac{(\sin 3x)^2}{4x}\right) = 3k + \lim_{x \to 0} \dfrac{(\sin 3x)^2}{4x}$.

We compute $\lim_{x \to 0} \dfrac{(\sin 3x)^2}{4x} = \lim_{x \to 0} \sin 3x \cdot \dfrac{\sin 3x}{4x}$.

We know that $\sin 3x \to 0$ as $x \to 0$, and that

$$\lim_{x \to 0} \frac{\sin 3x}{4x} = \frac{3}{4} \lim_{x \to 0} \frac{\sin 3x}{3x} = \frac{3}{4}(1) = \frac{3}{4}.$$

Thus, $\lim_{x \to 0} \dfrac{(\sin 3x)^2}{4x} = (0)(\dfrac{3}{4}) = 0.$

We conclude that for f to be continuous at $x = 0$, we must have $k + 4 = 3k$, or $k = 2$.

12. Using logarithmic differentiation, find the derivative of the following function in terms of x only.

$$y = (1+x)^{x^2}$$

Solution. Recalling that e^x and $\ln x$ are inverses of one another, we have

$$y = (1+x)^{x^2} = e^{\ln(1+x)^{x^2}} = e^{x^2\ln(1+x)}.$$

Letting $u = x^2\ln(1+x)$, we thus have that $y = e^u$. By the chain rule,

$$\begin{aligned}
\frac{dy}{dx} &= \frac{dy}{du}\frac{du}{dx} \\
&= \frac{d}{du}(e^u)\ \frac{d}{dx}(x^2\ln(1+x)) = e^u\ (2x\ln(1+x) + x^2(\frac{1}{1+x})) \\
&= e^{x^2\ln(1+x)}\ (2x\ln(1+x) + \frac{x^2}{1+x}) = e^{\ln(1+x)^{x^2}}\ (2x\ln(1+x) + \frac{x^2}{1+x}) \\
&= (1+x)^{x^2}\ (2x\ln(1+x) + \frac{x^2}{1+x}) = x\ (1+x)^{x^2}\ (2\ln(1+x) + \frac{x}{1+x}).
\end{aligned}$$

Alternative: Consider $\ln(y) = \ln(1+x)^{x^2} = x^2\ln(1+x)$.

$$\begin{aligned}
\frac{d}{dx}(\ln(y)) &= \frac{d}{dx}(x^2\ln(1+x)) \\
\frac{1}{y}\cdot\frac{dy}{dx} &= x^2\cdot\frac{1}{1+x} + 2x\ln(1+x) \\
\frac{dy}{dx} &= y\left(\frac{x^2}{1+x} + 2x\ln(1+x)\right) \\
&= (1+x)^{x^2}\ \left(2x\ln(1+x) + \frac{x^2}{1+x}\right)
\end{aligned}$$

13. (a) Find the instantaneous rate of change of $f(x) = \ln\left(\dfrac{e^x+2}{e^x+4}\right)$.

Solution. We seek to find $f'(x)$. We could use the chain rule, followed by the quotient rule on $\dfrac{e^x+2}{e^x+4}$, but that would be a lot of work. So instead, let's remember properties of logarithms, and write

$$f(x) = \ln\left(\frac{e^x+2}{e^x+4}\right) = \ln(e^x+2) - \ln(e^x+4).$$

Now we use the chain rule to obtain

$$\begin{aligned}
f'(x) &= \frac{1}{e^x+2}\,\frac{d}{dx}(e^x+2) - \frac{1}{e^x+4}\,\frac{d}{dx}(e^x+4) \\
&= \frac{1}{e^x+2}\,(e^x) - \frac{1}{e^x+4}\,(e^x) \\
&= e^x\left[\frac{1}{e^x+2} - \frac{1}{e^x+4}\right] \\
&= \frac{2e^x}{(e^x+2)(e^x+4)}.
\end{aligned}$$

(b) A balloon is released at a point P, 20 feet from an observer O, on a hot day with still air (See figure below). If the balloon is rising **vertically** at 3 ft/sec, how fast is the angle θ of elevation of O changing when $\theta = \pi/4$ radians? Your answer should contain no trigonometric functions.

Solution. Letting h denote the height of the balloon, as in the figure, and letting t denote time, we are given $\left.\dfrac{dh}{dt}\right|_{\theta=\pi/4} = 3$. We wish to find $\left.\dfrac{d\theta}{dt}\right|_{\theta=\pi/4}$. By basic trigonometry, we have

$$\tan\theta = \frac{h}{20},$$

and so by implicit differentiation and the chain rule,

$$\sec^2\theta\,\frac{d\theta}{dt} = \frac{1}{20}\,\frac{dh}{dt}.$$

Thus,

$$
\begin{aligned}
\left.\frac{d\theta}{dt}\right|_{\theta=\pi/4} &= \frac{1}{20\sec^2\theta}\left.\frac{dh}{dt}\right|_{\theta=\pi/4} \\
&= \frac{1}{20\sec^2(\pi/4)}\,(3) \\
&= \frac{3}{(20)(\frac{2}{\sqrt{2}})^2} \\
&= \frac{3}{40}.
\end{aligned}
$$

14. Use implicit differentiation to find $\dfrac{dy}{dx}$ if $e^{x+y} + xy = y^3$.

Solution. Using the chain rule, we differentiate the left-hand side with respect to x to get:

$$\begin{aligned}
\frac{d}{dx}(e^{x+y} + xy) &= (e^{x+y})\ \frac{d}{dx}(x+y) + \frac{d}{dx}(xy) \\
&= (e^{x+y})(1 + \frac{dy}{dx}) + (1 \cdot y + x\ \frac{dy}{dx}) \\
&= (e^{x+y})(1 + \frac{dy}{dx}) + (y + x\ \frac{dy}{dx}) \\
&= e^{x+y} + e^{x+y}\ \frac{dy}{dx} + y + x\ \frac{dy}{dx} \\
&= e^{x+y} + y + \frac{dy}{dx}(e^{x+y} + x).
\end{aligned}$$

On the right-hand side, we obtain

$$\frac{dy}{dx}(y^3) = 3y^2\ \frac{dy}{dx}.$$

Setting the two sides equal gives us

$$e^{x+y} + y + \frac{dy}{dx}(e^{x+y} + x) = 3y^2\ \frac{dy}{dx},$$

and so

$$\begin{aligned}
e^{x+y} + y &= \frac{dy}{dx}\ (3y^2) - \frac{dy}{dx}(e^{x+y} + x) \\
&= \frac{dy}{dx}\ (3y^2 - e^{x+y} - x).
\end{aligned}$$

We conclude that

$$\frac{dy}{dx} = \frac{e^{x+y} + y}{3y^2 - e^{x+y} - x}.$$

13. (a) Consider the curve given by

$$y^3 - 2xy = 5 - x^3.$$

Use **implicit differentiation** to find $\dfrac{dy}{dx}$.

Solution. Differentiating the left-hand side with respect to x gives us

$$\begin{aligned}
\frac{d}{dx}(y^3 - 2xy) &= \frac{d}{d(y)}(y^3)\ \frac{dy}{dx} - (2(1)y + 2x\frac{dy}{dx}) \\
&= 3y^2\frac{dy}{dx} - 2y - 2x\frac{dy}{dx} \\
&= (3y^2 - 2x)\frac{dy}{dx} - 2y,
\end{aligned}$$

whereas on the right-hand side we get

$$\frac{d}{dx}(5 - x^3) = -3x^2.$$

Setting the two sides and equal and solving for $\dfrac{dy}{dx}$ yields

$$\frac{dy}{dx} = \frac{2y - 3x^2}{3y^2 - 2x}.$$

A cool derivative!

(b) For a certain curve C: $\dfrac{dy}{dx} = \dfrac{x - y + 2}{x + y + 1}$. If the point $(1, -1)$ is on the curve, find the equation of the tangent line to C at $(1, -1)$.

Solution. We have

$$\left.\frac{dy}{dx}\right|_{(1,-1)} = \frac{1 - (-1) + 2}{1 + (-1) + 1} = \frac{4}{1} = 4.$$

The equation of the tangent line to C at the point $(1, -1)$ is thus given by

$$y = 4(x - 1) + (-1) = 4x - 5.$$

14. (a) Find the derivative of $y = (1+x)^{e^{2x}}$ using logarithmic differentiation.

Solution. We have

$$y = (1+x)^{e^{2x}} = e^{\ln\left((1+x)^{e^{2x}}\right)} = e^{e^{2x}\ln(1+x)}.$$

Thus, by the chain rule,

$$\begin{aligned}
\frac{dy}{dx} &= e^{e^{2x}\ln(1+x)}\,\frac{d}{dx}(e^{2x}\ln(1+x)) \\
&= (1+x)^{e^{2x}}\,\frac{d}{dx}(e^{2x}\ln(1+x)) \\
&= (1+x)^{e^{2x}}\left(\left(\frac{d}{dx}e^{2x}\right)\ln(1+x) + e^{2x}\left(\frac{d}{dx}\ln(1+x)\right)\right) \\
&= (1+x)^{e^{2x}}\left(\left(e^{2x}\cdot 2\right)\ln(1+x) + e^{2x}\left(\frac{1}{1+x}\right)\right) \\
&= (1+x)^{e^{2x}}\,e^{2x}\left(2\ln(1+x) + \frac{1}{1+x}\right).
\end{aligned}$$

(b) Water is flowing into an inverted cone of radius 1 m and height 2 m at a rate of 0.5 m^3/min. How fast is the **radius** of the water surface growing when its diameter is 1 m?

Solution. Let r be the radius of the water surface, h the water level, and V the volume. Then

$$V = \frac{1}{3}\pi r^2 h.$$

By similarity of triangles, we thus have the relationship

$$\frac{h}{r} = \frac{\text{height of cone}}{\text{radius of cone}} = \frac{2\text{ m}}{1\text{ m}} = 2,$$

and so $h = 2r$. Therefore,

$$V = \frac{1}{3}\pi r^2(2r) = \frac{2}{3}\pi r^3.$$

Letting t denote time in minutes, we are given that $\frac{dV}{dt} = 0.5$, or

$$0.5 = \frac{dV}{dt} = \frac{d}{dt}\left(\frac{2}{3}\pi r^3\right) = 2\pi r^2\frac{dr}{dt}.$$

Thus,

$$\frac{dr}{dt} = \frac{0.5}{2\pi r^2} = \frac{1}{4\pi r^2}.$$

Now we wish to find dr/dt when the diameter of the water surface is 1 m, or in other words, when the radius if 0.5 m. This is therefore

$$\left.\frac{dr}{dt}\right|_{r=0.5} = \frac{1}{4\pi(0.5)^2} = \frac{1}{4\pi(\frac{1}{2})^2} = \frac{1}{\pi}.$$

15. Cyclist A, approaching a right angled intersection from the north, is chasing cyclist B who has turned the corner and is now moving straight east. When cyclist A is 3 meters north of the corner, cyclist B is 4 meters east of the corner traveling at a speed of 10 meters per second. Given that the distance between A and B is **increasing** at a rate of 2 meters per second, find the speed of cyclist A.

Solution. Let $D(t)$ denote the distance between A and B, where t is the time in seconds. Let $A(t)$ denote the position of A at time t to the north of the origin, and $B(t)$ the position of B to the east of the origin. Notice that $A(t)$ and $B(t)$ are also the distances of A and B, respectively, from the origin. So, by the Pythagorean theorem, we have

$$D(t)^2 = A(t)^2 + B(t)^2.$$

Since distance is never negative, we thus have

$$D(t) = \sqrt{A(t)^2 + B(t)^2}.$$

We want to find the speed of A, or in other words, $\dfrac{dA}{dt}$, at the time t when $A(t) = 3$ m and $B(t) = 4$ m. Rewriting the first equation above gives

$$A(t)^2 = D(t)^2 - B(t)^2,$$

so by implicit differentiation,

$$2A(t)\frac{dA}{dt} = 2D(t)\frac{dD}{dt} - 2B(t)\frac{dB}{dt},$$

so

$$\frac{dA}{dt} = \frac{2D(t)\frac{dD}{dt} - 2B(t)\frac{dD}{dt}}{2A(t)} = \frac{D(t)\frac{dD}{dt} - B(t)\frac{dD}{dt}}{A(t)}.$$

Now at the time in question, we are given that

$$\frac{dD}{dt} = 2 \text{ m/sec}.$$

and that

$$\frac{dB}{dt} = 10 \text{ m/sec},$$

and we can figure out that

$$D(t) = \sqrt{(3)^2 + (4)^2} = \sqrt{25} = 5.$$

Thus, at this time, we have

$$\frac{dA}{dt} = \frac{(5)(2) - (4)(10)}{3} = \frac{10-40}{3} = -10 \text{ m/s}.$$

So A is going at a speed of 10 m/s in the direction of the origin, as indicated by the minus sign.

16. **(a)** Consider the function $f(x) = \sqrt[3]{x}$.

(i) Find the linear approximation of $f(x)$ at $x = -8$.

Solution. We have $f(x) = x^{1/3}$ so $f'(x) = \frac{1}{3}x^{-2/3}$ and $f'(-8) = \frac{1}{3}(-8)^{-2/3} = \frac{1}{3}(-2)^{-2} = \frac{1}{3\cdot 2^2} = \frac{1}{12}$. The equation for the linear approximation to f at $x = -8$ is thus

$$L(x) = \frac{1}{12}(x+8) - 2.$$

(ii) Using (i), estimate the value of $\sqrt[3]{-7.8}$.

Solution. We have that

$$f(-7.8) \approx L(-7.8) = \frac{0.2}{12} - 2 = \frac{1}{60} - 2 = -\frac{119}{60}.$$

(b) Air is pumped into a perfectly spherical balloon of radius r. Using calculus, estimate the percentage change in the volume of the balloon when the radius changes from 3 cm to 3.05 cm. You may use the formula $V = \dfrac{4\pi r^3}{3}$.

Solution. The change in V as r increases from 3 to 3.05 is given by

$$\Delta V \approx V'(3)\Delta r = V'(3)(3.05 - 3) = V'(3)(0.05).$$

From the formula for V, we have

$$V'(r) = 4\pi r^2,$$

and so $V'(3) = 4\pi(3)^2 = 36\pi$. Thus

$$\Delta V = (36\pi)(0.05) = 1.8\pi.$$

The volume at $r = 3$ is $V(3) = \dfrac{4}{3}\pi(27) = 36\pi$

The percentage change is given by

$$\frac{\Delta V}{V(3)} \times 100\% \approx \frac{1.8\pi}{36\pi} \times 100\% = 5\%.$$
