## **QUIZ** 11

## ADRIAN PĂCURAR

Time: 20 minutes

**Problem 1.** Given  $f(x) = x^2 - 2$  and initial guess  $x_1 = 1$ , use Newton's method to the approximations  $x_2$  and  $x_3$  for roots of f.

**Problem 2.** Notice that  $f(x) = x^2 - 1$  has two roots,  $\pm 1$ . Using initial guess  $x_1 = 1$ , use Newton's Method to find  $x_{2016}$ . (Hint: what happens if you plug in the root of f into Newton's formula. Compute  $x_2$  and  $x_3$ , then give an answer based on any pattern you see).

**Problem 3.** The equation for the slant asymptote of the curve  $y = \frac{2x^3 + 4}{x^2 - x + 1}$  is (b) 2 (c)  $x^2 - x + 1$ (a) 2x - 2(d) 2x (e) 2x + 2

**Problem 4.** Find the antiderivatives of the following functions

a) 
$$f(x) = 2x$$
, so  $F(x) =$ \_\_\_\_\_\_

b) 
$$f(x) = \cos x$$
, so  $F(x) =$ \_\_\_\_\_

c) 
$$f(x) = 3^x \ln 3$$
 so  $F(x) =$ \_\_\_\_\_\_

d) 
$$f(x) = \frac{1}{\cos^2 x}$$
, so  $F(x) =$ \_\_\_\_\_\_

e) 
$$f(x) = x^4$$
, so  $F(x) =$ \_\_\_\_\_

f) 
$$f(x) = 2x\sqrt{x^2 + 8}$$
, so  $F(x) =$ \_\_\_\_\_\_

**Problem 5.** Which one of the following functions has a slant asymptote?

(a) 
$$\frac{3x^2 + x + 3}{x^2 + 4}$$

(a) 
$$\frac{3x^2 + x + 3}{x^2 + 4}$$
 (b)  $\frac{2x^3 + x^2 + 1}{x^2 + 2}$  (c)  $\frac{x^6 + x + 3}{x^3 + 2x}$ 

(c) 
$$\frac{x^6 + x + 3}{x^3 + 2x}$$
